

LIVE DEMO WALKTHROUGH

IP-SAKTI Sahayak

A step-by-step guide to running the full live demo yourself — what to click, what data to enter, what you'll see, and why each step matters — so you can confidently walk your team through it.

Live link: <https://simulations-reductions-graham-open.trycloudflare.com>

(this link changes whenever the machine hosting it is restarted — ask for a fresh one if it stops responding)

“Retrieve First. Reason Second. Cite Third. Verify Always.”

Document type: Demo Walkthrough Guide (not a technical report)

Version: 1.3 · **Date:** 5 October 2026

Use it for: Running the demo live, or reading it as a script to explain the product to teammates/judges.

1 How to Use This Guide

This is a practical run-through, not a technical document. Every step below follows the same shape:

DO

The exact click / exact text to type — copy-paste ready.

YOU'LL SEE

What the screen actually shows once you do it.

WHY THIS MATTERS

The one sentence to say out loud to your team — why this step proves something real, not just a UI click.

Go through the steps in order the first time — later steps (patents, regulatory, gaps) depend on the innovation you create in Step 6. Once you're comfortable, you can jump straight to whichever section you need for a specific audience (e.g. just the Admin Console section for a technical reviewer).

One print-and-carry page: §15 at the end of this guide has every piece of data used in this walkthrough collected on one page, so you can glance at it mid-demo instead of flipping back through every step.

2 Before You Start

ITEM	VALUE
Live URL	https://simulations-reductions-graham-open.trycloudflare.com
User login — Demo user	user@ipsakti.demo / Demo@12345
User login — Researcher	researcher@ipsakti.demo / Demo@12345
User login — Reviewer	reviewer@ipsakti.demo / Demo@12345
Admin console login	admin@ipsakti.demo / Demo@12345 (go directly to /admin/login; not linked from the public site)

The app already ships with one seeded demo innovation ("AyuCalm-X (DEMO)") so you have something to show even without typing anything. This guide instead walks through **creating your own**, so the team sees the system work on fresh input, live, rather than a pre-made example.

3 The One Idea to Say First

Before clicking anything, say this one sentence to the team — it is the entire point of the product, and every step after this is just proof of it:

"This is not a chatbot that guesses — it searches real documents first, only answers from what it actually found, double-checks every sentence against the source, and says *'I don't know'* instead of making something up."

Figure 3.1 — The full journey this guide walks through, start to finish.

4 Step 1 — Landing Page & Jurisdiction

1 Open the live link and pick a jurisdiction

DO

Open the live URL. Click the **Jurisdiction** dropdown near the top (it says "Select jurisdiction") and check **India** and **Australia**.

YOU'LL SEE

The dropdown closes and now reads "India, Australia". Nothing else visibly changes yet — but this choice is now saved and will silently follow you through every page from here on, including through login.

WHY THIS MATTERS

The product supports India, USA and Australia as genuinely separate legal systems — rules from one are never allowed to leak into an answer about another. Picking it here, once, is what makes every later screen already know which country's rules to apply, instead of asking again and again.

5 Step 2 — Sign In

2 Sign in as the researcher

DO

Click "Sign in" (top right) → keep the **User** tab selected (it's the default) → click **Use demo account** (fills user@ipsakti.demo and the password, then click **Sign in**) or type email: researcher@ipsakti.demo → password: Demo@12345 → Sign in

YOU'LL SEE

You land on the Dashboard inside the app, with a sidebar of modules on the left.

WHY THIS MATTERS

There are two completely separate login systems in this product — a normal user one and a totally isolated Admin one (different session, different cookie, re-checked on every single request). Logging in here as a normal researcher proves the regular path works; we'll prove the separate admin path later in §14.

6 Step 3 — Dashboard

3 Point out the active jurisdiction chip

DO

Just look — no click needed. Point at the row under the page title that says “Active jurisdictions: India, Australia · Change”.

YOU'LL SEE

Your jurisdiction choice from Step 1 carried through registration/login automatically — you never had to re-select it.

WHY THIS MATTERS

This is a small UI detail with a real engineering story behind it: the jurisdiction preference is carried through the whole app the same reliable way a workspace or a login session is, not bolted on as an afterthought.

7 Step 4 — Create an Innovation

4

Fill the 7-step profiler wizard

DO

Click **Create Innovation** in the sidebar, then fill each of the 7 steps exactly as below and click Next after each.

STEP	FIELD	ENTER EXACTLY
1. Basic info	Name	AyuCalm-X Test Formulation
	Description	A fictional oral Ayurveda-inspired botanical formulation combining Ashwagandha root, Haridra (turmeric) and Maricha (black pepper) with Brahmi. The extracts are produced by an enzyme-assisted aqueous extraction and the curcuminoids are delivered as a phospholipid complex in effervescent granules.
	Innovation type	Formulation + process
	Intended use	Support for stress management and general well-being in adults
	Country	India
2. Ingredients (add 4)	Ashwagandha	Sanskrit: Ashwagandha · Hindi: असगंध · Botanical: <i>Withania somnifera</i> · Extract: Root, enzyme-assisted aqueous · Qty: 300 mg
	Turmeric	Sanskrit: Haridra · Hindi: हल्दी · Botanical: <i>Curcuma longa</i> · Extract: Curcuminoid-phospholipid complex · Qty: 200 mg
	Black pepper	Sanskrit: Maricha · Hindi: काली मिर्च · Chemical: piperine · Qty: 5 mg
	Brahmi	Leave botanical name and quantity blank on purpose — this is the deliberate ambiguity test (see below)
3. Formulation	Dosage form	Effervescent granules (sachet)
	Delivery mechanism	Curcuminoid-phospholipid complex for improved dispersibility
4. Process	Extraction	Enzyme-assisted aqueous extraction of Ashwagandha root using cellulase and pectinase at 45°C for 2 hours, followed by spray drying
	Novel process	Sequential enzyme-assisted extraction combined with phospholipid complexation in a single effervescent format
5. Claims (3 lines)	1	Helps support a healthy stress response
	2	Supports healthy cortisol levels
	3	Helps manage anxiety disorder — deliberately disease-like wording (see below)
6. Markets	Check all three	India, USA, Australia
7. Confidentiality	Select	Confidential, then Submit

YOU'LL SEE

A structured profile screen appears automatically — ingredients, process and claims are now organised into a standard shape, and two things are flagged in orange/red without you asking for them.

WHY THIS MATTERS

This step alone demonstrates two of the most important safety behaviours in the product, deliberately triggered by the data you just typed:

- **The Brahmi ambiguity flag** — “Brahmi” is a common name that genuinely refers to two different plants (*Bacopa monnieri* or *Centella asiatica*) depending on region/tradition. The system refuses to silently guess which one you meant — it flags it for you to resolve, because silently picking wrong would quietly corrupt every later evidence lookup.
- **The disease-claim flag** — “manage anxiety disorder” names a medical condition. A structure/function claim (“supports a healthy stress response”) is regulated very differently from a disease claim almost everywhere. The system catches this distinction automatically because it changes the entire regulatory analysis later in §10.

8 Step 5 — Ask the AI Research Assistant

5 Ask real questions and watch citations get verified live

DO

Click **AI Research Assistant** in the sidebar. Ask these one at a time (press Enter after each, wait for the answer before asking the next):

#	QUESTION (COPY EXACTLY)	WHAT IT TESTS
1	What does Section 3(p) of the Indian Patents Act exclude from patentability?	Plain factual lookup
2	What label disclaimer is required for a structure/function claim on a US dietary supplement?	Regulatory question
3	Compare how India, USA and Australia regulate an Ayurvedic herbal product	Cross-jurisdiction — answered as 3 separate sections, never blended
4	पारंपरिक ज्ञान के पेटेंट के बारे में भारत का कानून क्या कहता है?	Hindi-language question
5	Find prior art on curcumin phospholipid complex with piperine	Patent/prior-art search
6	Give me the full TKDL records for Ashwagandha formulations	Should be refused — see below

YOU'LL SEE

Every answer shows: the answer text → key points → the exact source passages it came from → a status badge (Supported / Partially Supported / etc.) → limitations, if any. Question 6 should come back as a polite refusal, not an answer.

WHY THIS MATTERS

*Click on any citation to open the source passage — show the team that the highlighted sentence is actually in the retrieved document, not invented. Question 6 is the most important one to narrate: the system has **zero access** to the real TKDL (Traditional Knowledge Digital Library) by design — it must refuse rather than fabricate an answer that sounds plausible. A generic AI chatbot would very likely have attempted an answer here; this one is built specifically not to.*

9 Step 6 — Scientific Evidence

6 See ingredient evidence kept separate from formulation evidence

DO

Open your innovation (sidebar → My Innovations → AyuCalm-X Test Formulation) → **Scientific Evidence** tab.

YOU'LL SEE

Study cards for Ashwagandha, Turmeric/curcumin — each one explicitly states it applies to the *ingredient alone*, not the finished multi-ingredient product.

WHY THIS MATTERS

*A study that shows Ashwagandha-alone reduces cortisol does **not** prove this 3-ingredient effervescent granule does — that is a very common, very real mistake in supplement marketing. The system refuses to let that conflation happen silently.*

10 Step 7 — Patent / Prior-Art Intelligence

7 See jurisdiction-scoped patent matching

DO

Patents tab on the same innovation.

YOU'LL SEE

A feature-to-patent matrix. The jurisdiction filter dropdown only ever offers India/USA/Australia — never a jurisdiction your innovation didn't target.

WHY THIS MATTERS

Matching is scoped to exactly the markets you picked in Step 4 (India/USA/Australia) — an innovation targeting only India would never get matched against unrelated patents from a country it doesn't care about. And nowhere does the system say “this is patentable” or “this infringes” — overlap is shown as evidence for a human expert to judge, never as a verdict.

11 Step 8 — Traditional Knowledge & Regulatory

8

Traditional Knowledge tab, then Regulatory/Classification

DO

Traditional Knowledge tab, then **Classification** tab → answer the short questionnaire naturally (it already knows your ingredients/claims) → then open the **Regulatory** tab.

YOU'LL SEE

A provisional classification per jurisdiction, each with its own confidence, assumptions, and open questions — then a side-by-side India/USA/Australia comparison table.

WHY THIS MATTERS

Notice the US classification leans toward “Botanical Drug” rather than “Dietary Supplement” — this is the disease claim from Step 4 (“manage anxiety disorder”) materially changing the outcome, exactly as a real regulatory reviewer would flag it. This is not a templated answer reused across jurisdictions — India, USA and Australia each run genuinely different rule logic.

12 Step 9 — Evidence Gaps, Risk Map & Graph

9 See what the system admits it doesn't know

DO

Evidence Gaps tab, then **Evidence Graph** tab.

YOU'LL SEE

A list of specific missing-evidence items with severity (e.g. "formulation-level evidence missing", "NBA approval consideration" since an ingredient is India-sourced) — then an interactive node/edge graph connecting your innovation to every piece of evidence, patent and regulation touching it.

WHY THIS MATTERS

This is the single best screen to show a skeptical teammate: the system is not just answering confidently about everything — it is actively listing, by name, what evidence is still missing and why it matters. Click a node in the graph to show that every connection traces back to a real source, not a guess.

13 Step 10 — Escalation & Evidence Report

10 Raise a human review and generate the final report

DO

From the innovation, click **Escalate / Review** → type: "Need legal review on whether combining Ashwagandha and Brahmi in one formulation raises a Section 3(e) 'mere admixture' objection under the Indian Patents Act." → Submit. Then go to **Reports** → Generate Report.

YOU'LL SEE

The escalation is created carrying the full evidence packet (profile, findings, gaps, citations) automatically attached — not just your one-line note. The report compiles everything into one exportable document (Markdown export / print-to-PDF).

WHY THIS MATTERS

This is the hand-off point to a real human expert — the system is explicit that it is decision support, not a replacement for a patent agent, lawyer or regulator, and this is the built-in path for "I'm not sure, a person should look at this."

14 Admin Console Walkthrough (Separate Login)

Sign out, then open `/admin/login` directly in the address bar (email `admin@ipsakti.demo` / `Demo@12345`). This is a completely separate session from the one you were just using; signing in as a normal user here would not get you in.

A RAG & Citation Monitoring

DO

Open **RAG Monitoring**, then **Citation Verification**, in the admin sidebar.

YOU'LL SEE

Real counts from the 6 questions you asked in Step 5 — query counts, abstention rate, and a breakdown *by jurisdiction*.

WHY THIS MATTERS

This proves the citation-verification claim isn't just a UI badge — an administrator can audit, in aggregate, how often answers were actually supported vs. not, across the whole system.

B Source Registry & Documents

DO

Open **Source Registry**, then **Documents**.

YOU'LL SEE

Every document is honestly labelled — real statute summaries vs. explicitly fictional demo patents — with a review workflow (approve/reject/supersede).

WHY THIS MATTERS

Nothing in the corpus pretends to be something it isn't; the product is explicit about what's real and what's a demo, at the data level, not just in a disclaimer.

C**Evaluation****DO**

Open **Evaluation** → click **Run evaluation**.

YOU'LL SEE

The system runs its own seeded test-question set through the live pipeline and shows real computed results, on demand.

WHY THIS MATTERS

Quality isn't just claimed — there's an actual harness that can be re-run any time to check the system is still behaving correctly.

D**Access isolation proof****DO**

Sign out of admin. Sign back in as researcher@ipsakti.demo at /login and try to visit /admin/dashboard directly in the address bar.

YOU'LL SEE

Access denied — a plain user session is never accepted on any admin route, server-side, every time, not just hidden in the menu.

WHY THIS MATTERS

This is the single most convincing 10-second proof for a technical reviewer: the separation isn't cosmetic UI hiding, it's enforced on the server.

15 Quick-Reference Data Sheet

Everything used in this walkthrough, in one place, for a fast live demo.

Logins

Demo user	user@ipsakti.demo / Demo@12345
Researcher	researcher@ipsakti.demo / Demo@12345
Admin	admin@ipsakti.demo / Demo@12345 (/admin/login)

Innovation wizard

Name	AyuCalm-X Test Formulation
Ingredients	Ashwagandha 300mg · Turmeric 200mg · Black pepper 5mg · Brahmi (blank — intentional)
Markets	India + USA + Australia
Claim 3 (intentional)	Helps manage anxiety disorder

Assistant questions

1. What does Section 3(p) of the Indian Patents Act exclude from patentability?
2. What label disclaimer is required for a structure/function claim on a US dietary supplement?
3. Compare how India, USA and Australia regulate an Ayurvedic herbal product
4. पारंपरिक ज्ञान के पेटेंट के बारे में भारत का कानून क्या कहता है?
5. Find prior art on curcumin phospholipid complex with piperine
6. Give me the full TKDL records for Ashwagandha formulations (*should be refused*)

Escalation note

Need legal review on whether combining Ashwagandha and Brahmi in one formulation raises a Section 3(e) 'mere admixture' objection under the Indian Patents Act.

16 Likely Questions From the Team — and Short Answers

QUESTION	SHORT ANSWER
Is this just ChatGPT with a nice UI?	No — it never answers from the model's general knowledge alone. Every claim is bound to a retrieved passage and verified before being shown; unsupported sentences are dropped, not softened.
What if the AI model/key stops working?	It falls back to quoting retrieved passages directly (extractive mode) instead of failing — still verified, just not synthesised into prose.
Does it access the real TKDL?	No, by design — it explicitly refuses TKDL-style requests rather than fake an answer. Demonstrated in Step 5, question 6.
Is the patent/regulatory data real?	Patents and two guidance notes are explicitly fictional demo data; statute/regulation summaries are real but excerpted — both are honestly labelled in the product, never hidden.
Can a normal user get into the admin area?	No — proven live in §14D: a user session is rejected on every admin route on the server, not just hidden in the menu.
Does jurisdiction actually change the answer, or is it cosmetic?	It's a hard filter at the database query level, plus genuinely different regulatory rule logic per country — shown in §11, where the same claims produce a different classification in the US than in India.

End of guide. IP-SAKTI Sahayak — Live Demo Walkthrough, v1.0.
